

Regression:

A machine learning perspective

Emily Fox & Carlos Guestrin
Machine Learning Specialization
University of Washington

Part of a specialization

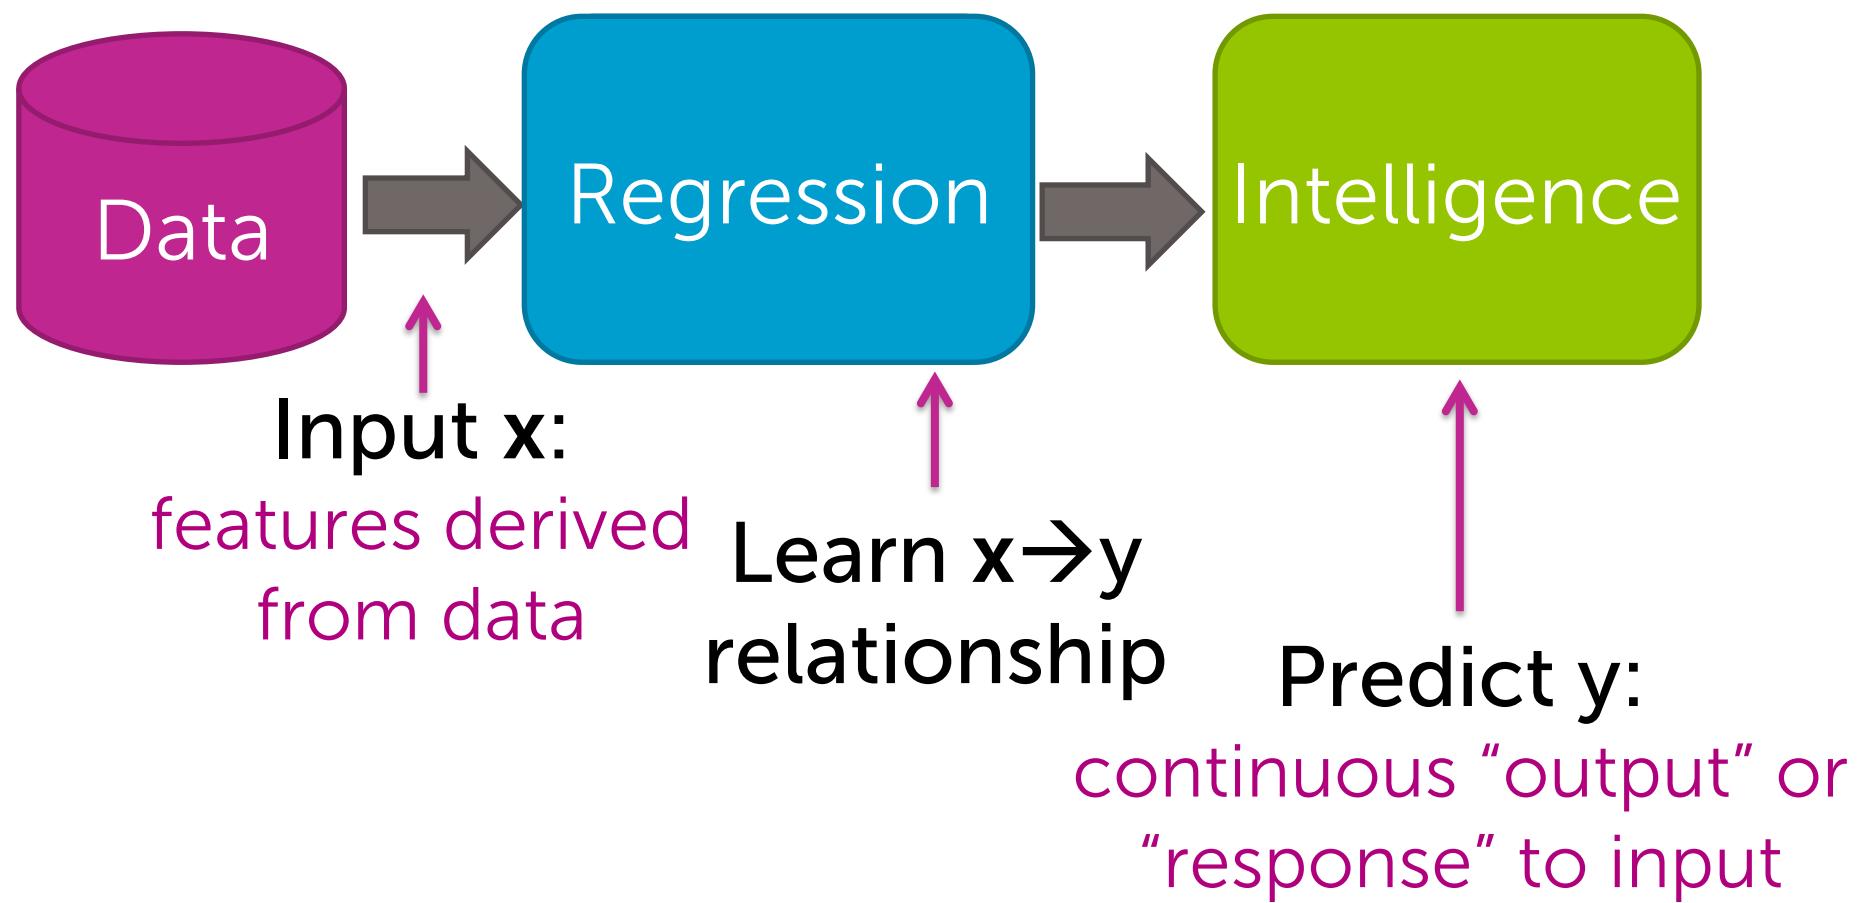

This course is a part of the Machine Learning Specialization

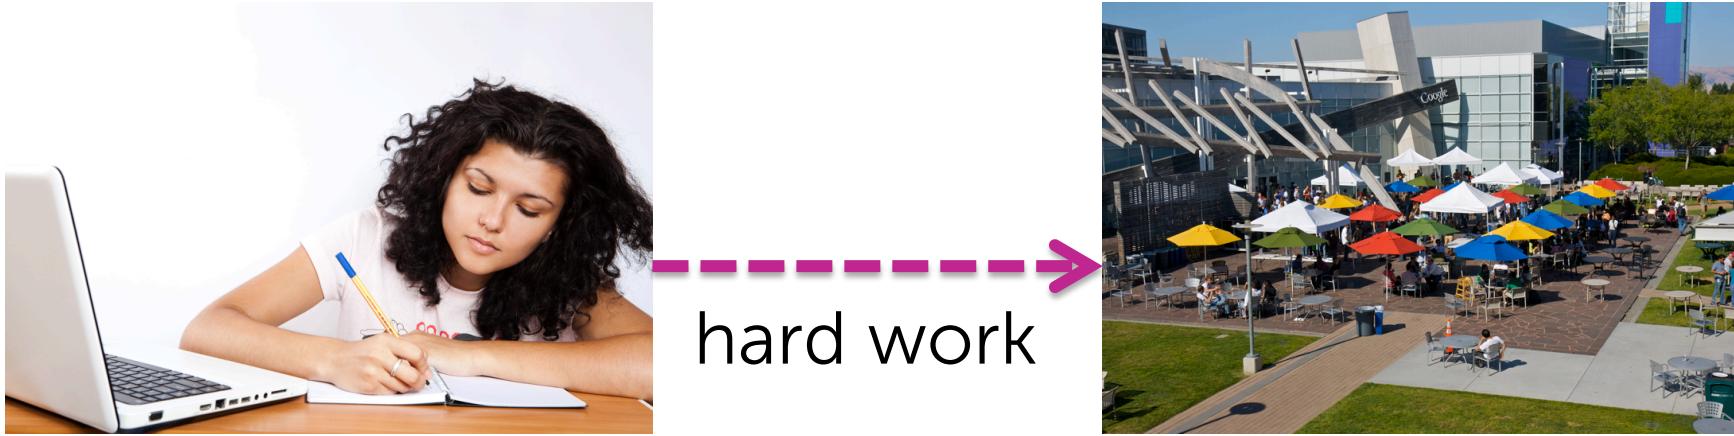

What is the course about?

What is regression?

From features to predictions

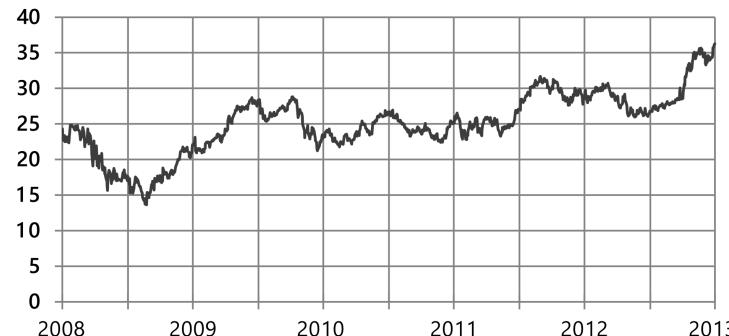

Salary after ML specialization

- How much will your salary be? ($y = \text{ $$}$)
- Depends on $x = \text{ performance in courses, quality of capstone project, \# of forum responses, ...}$

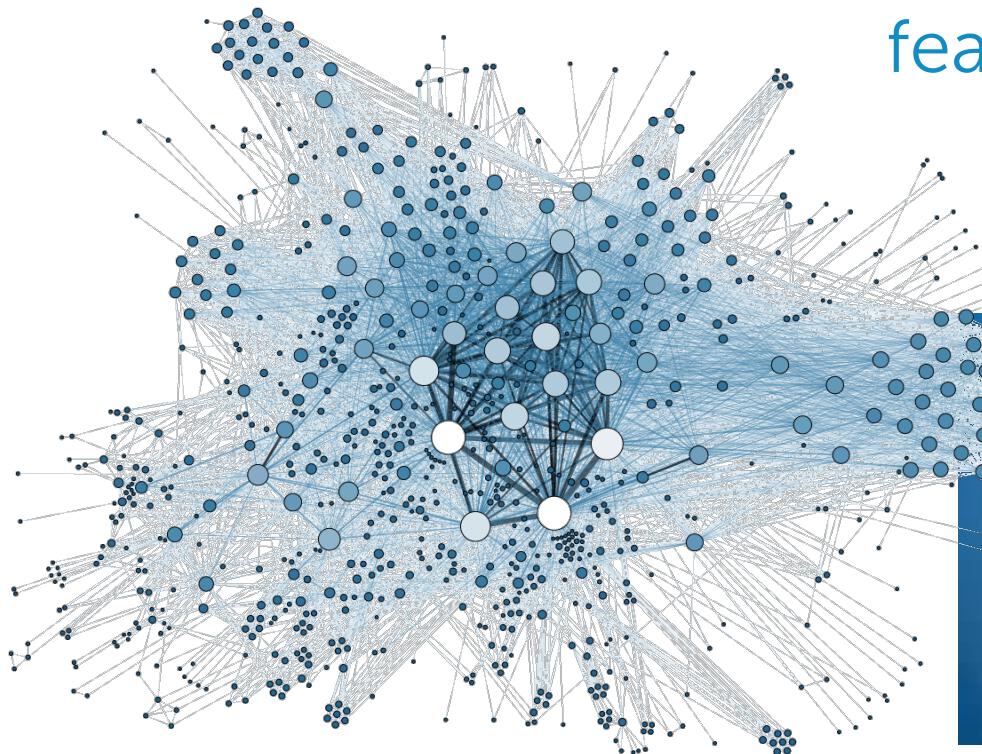

Stock prediction

- Predict the price of a stock (y)
- Depends on $x =$
 - Recent history of stock price
 - News events
 - Related commodities

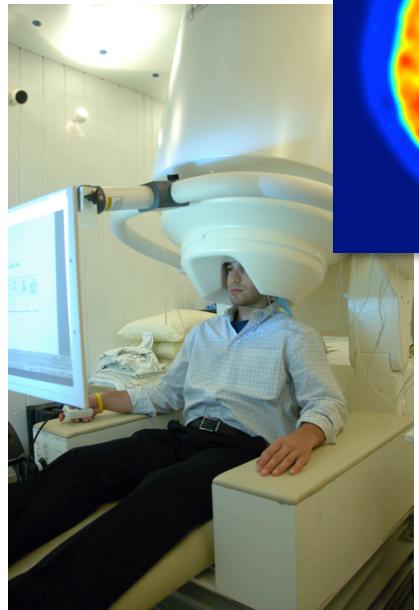

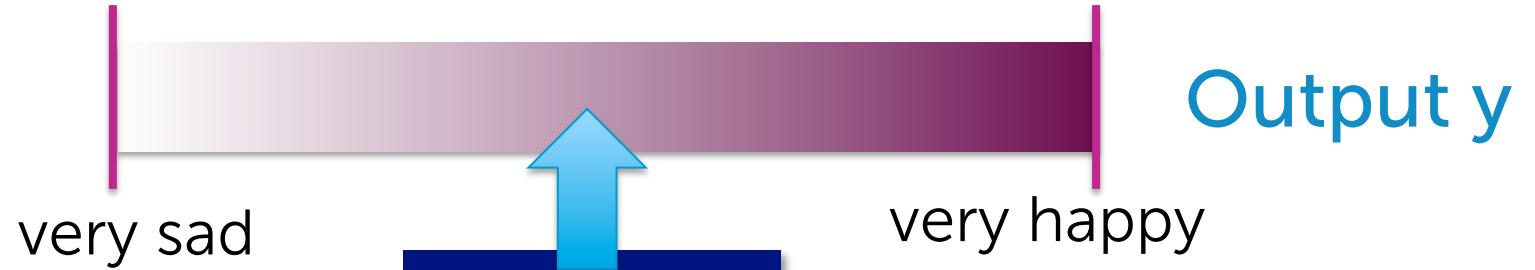

Tweet popularity

- How many people will retweet your tweet? (y)
- Depends on $x = \# \text{ followers}$,
 $\# \text{ of followers of followers}$,
 $\text{features of text tweeted}$,
 $\text{popularity of hashtag}$,
 $\# \text{ of past retweets}$,...

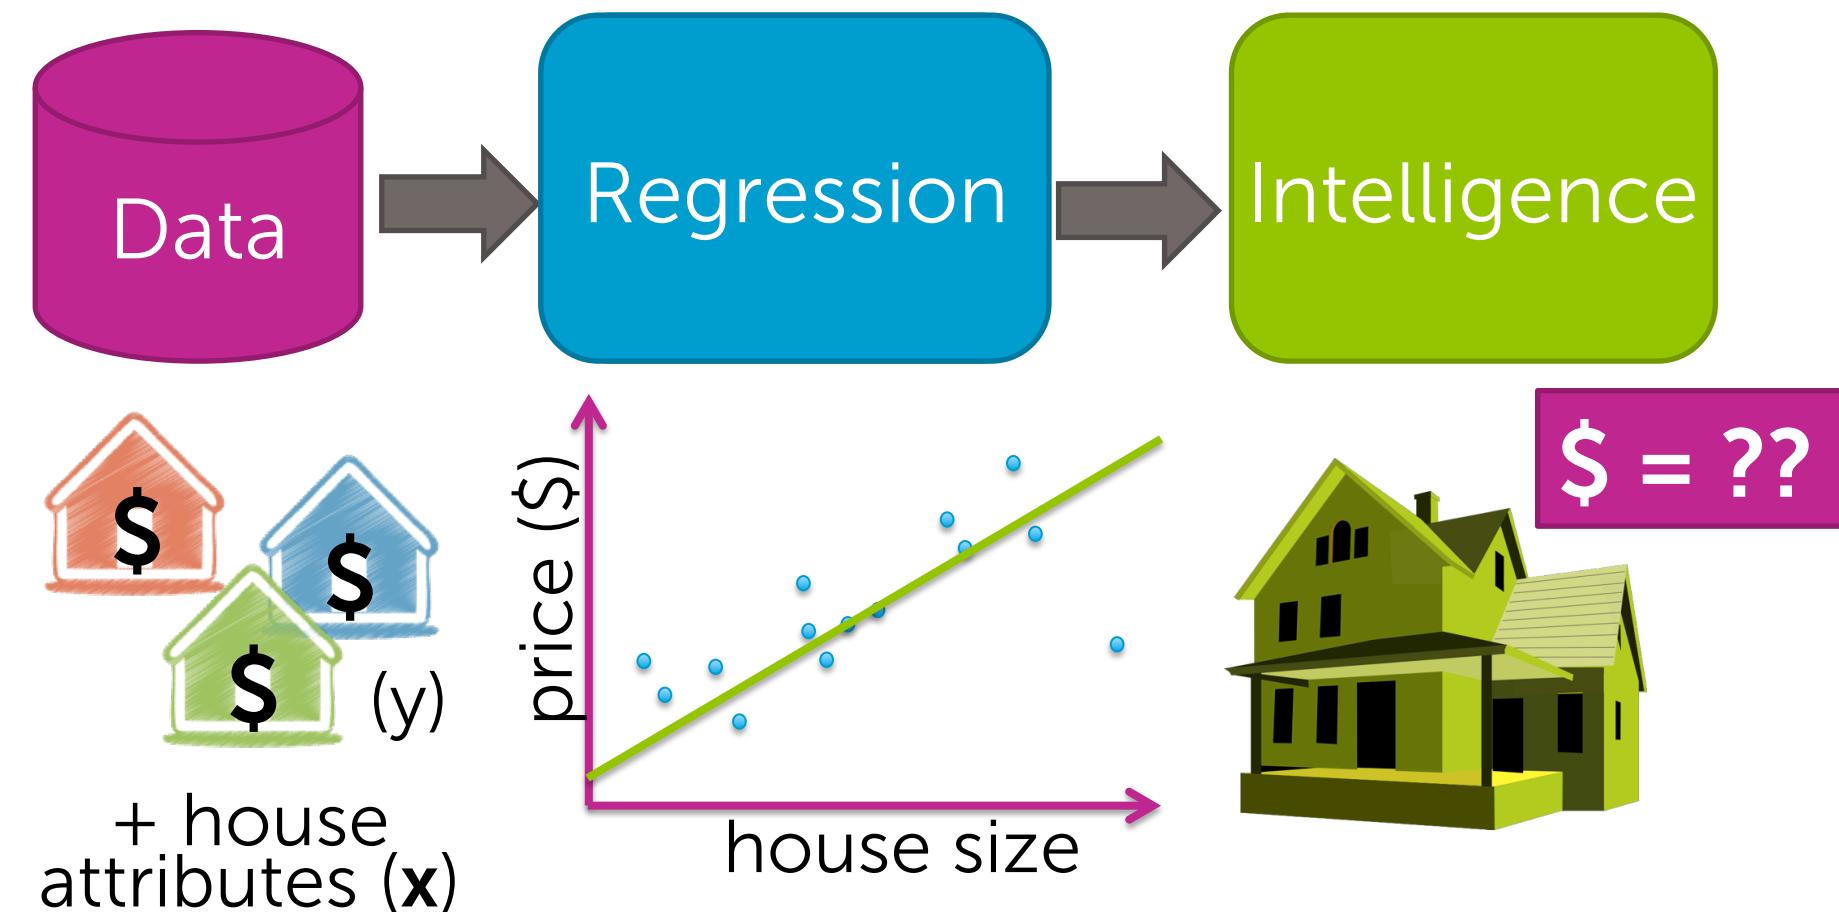

Reading your mind

Inputs x are
brain region
intensities

Case Study: Predicting house prices

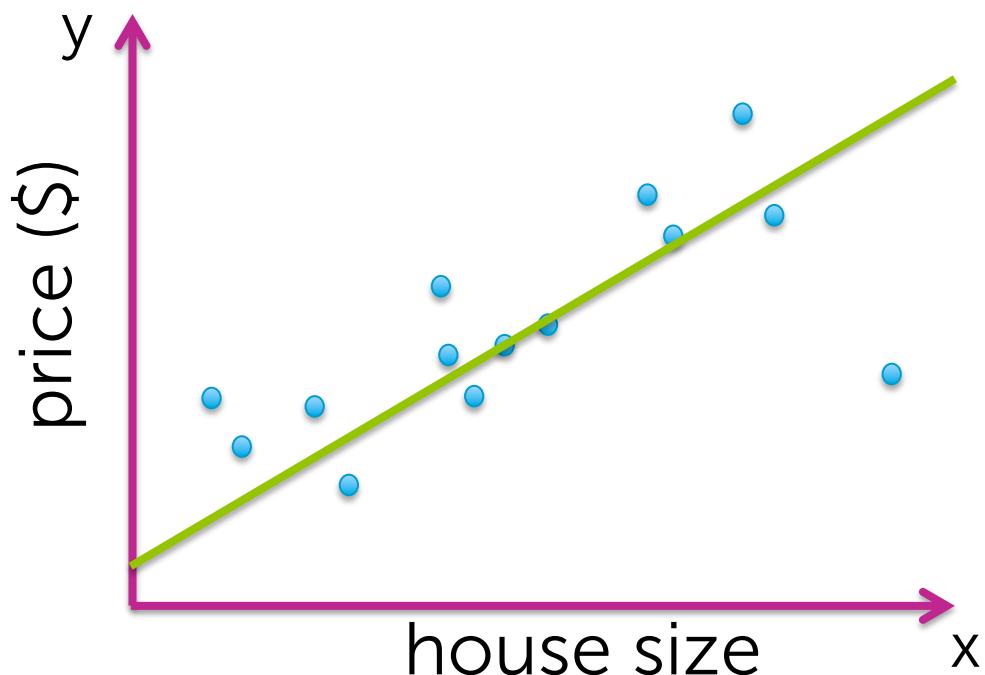

Impact of regression

Course outline

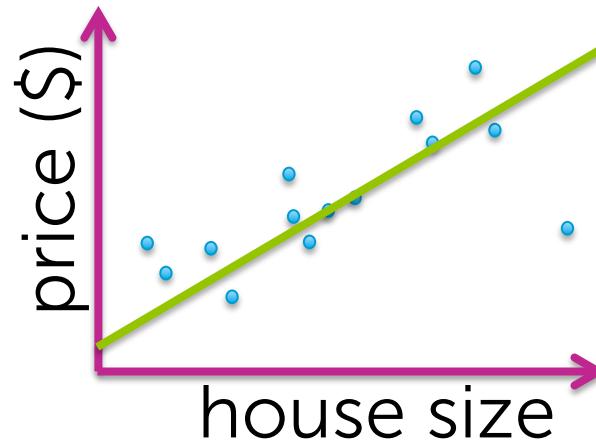

Module 1: Simple Regression

What makes it simple?

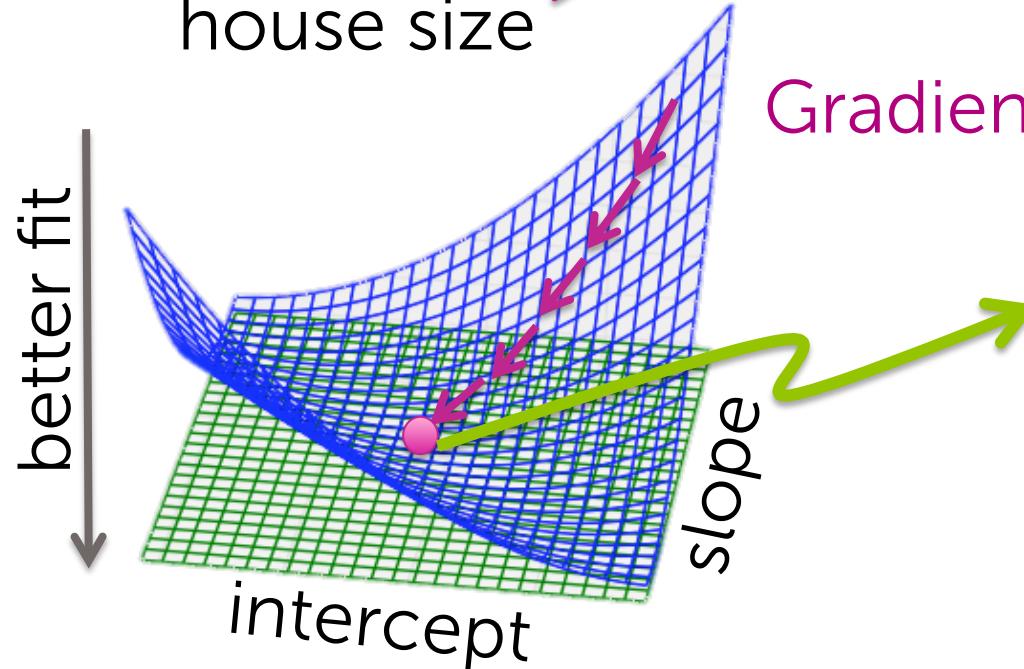

1 input and just fit a line to data

Module 1: Simple Regression

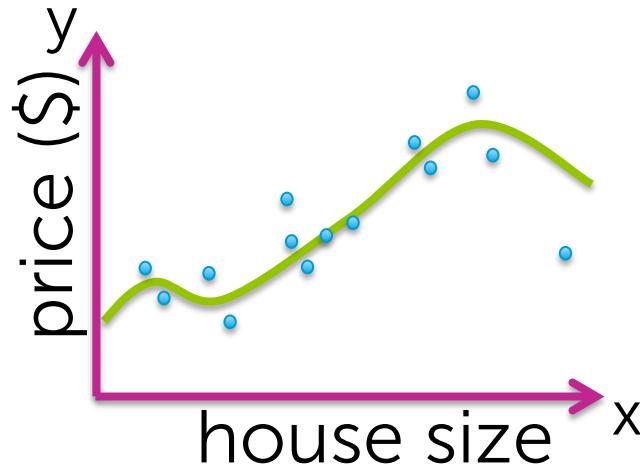

Define **goodness-of-fit** metric for each possible line

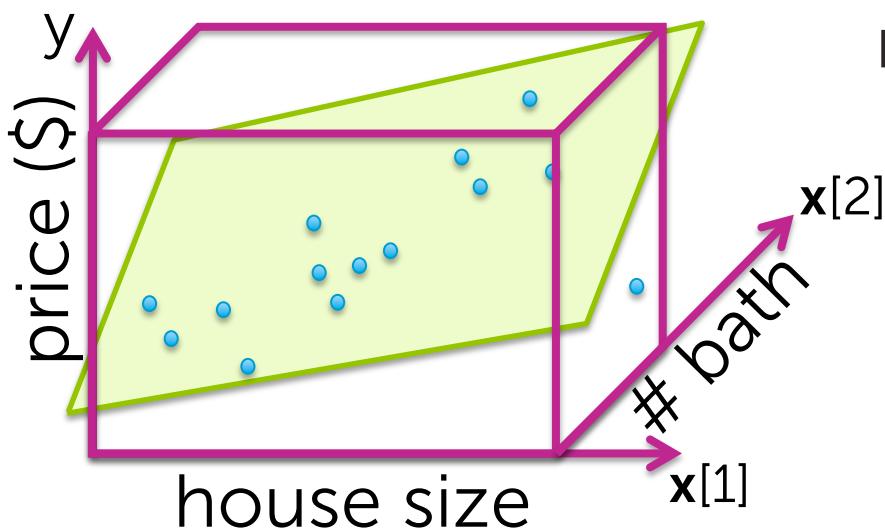

Gradient descent algorithm

Get estimated parameters
– interpret
– use to form predictions

Module 2: Multiple Regression

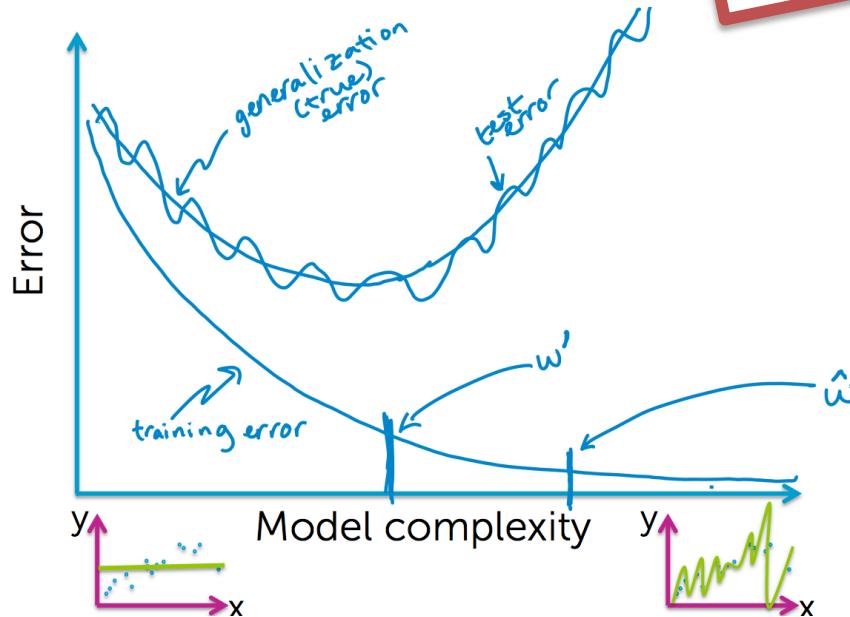

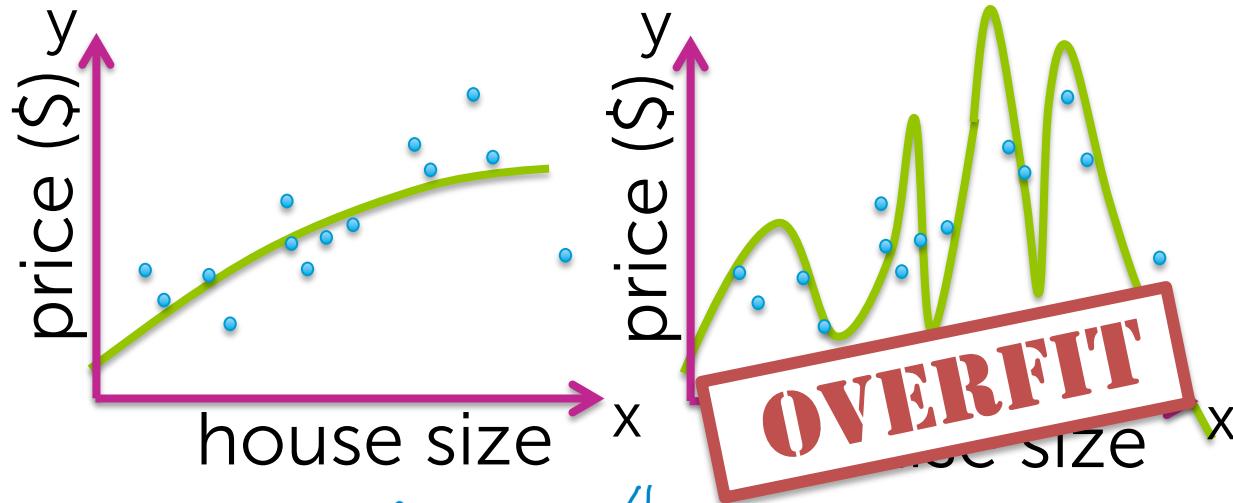

Fit **more complex relationships** than just a line

Incorporate more inputs

- Square feet
- # bathrooms
- # bedrooms
- Lot size
- Year built
- ...

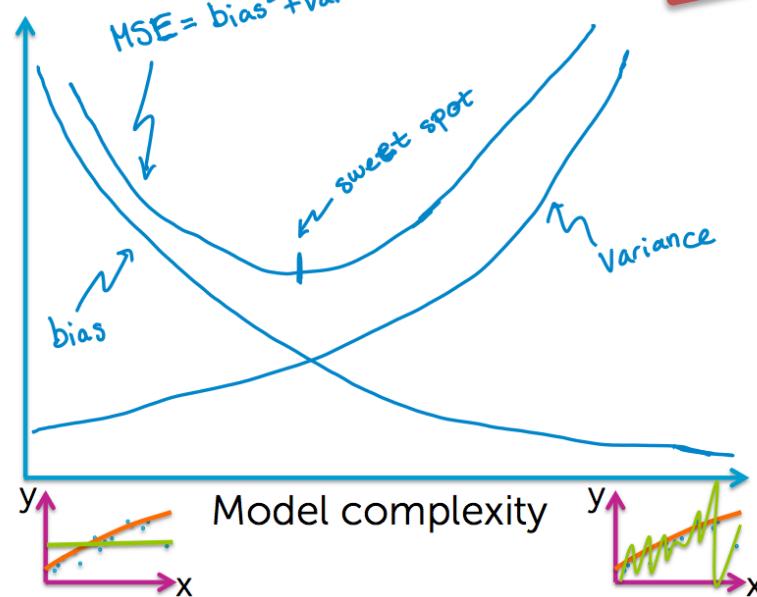

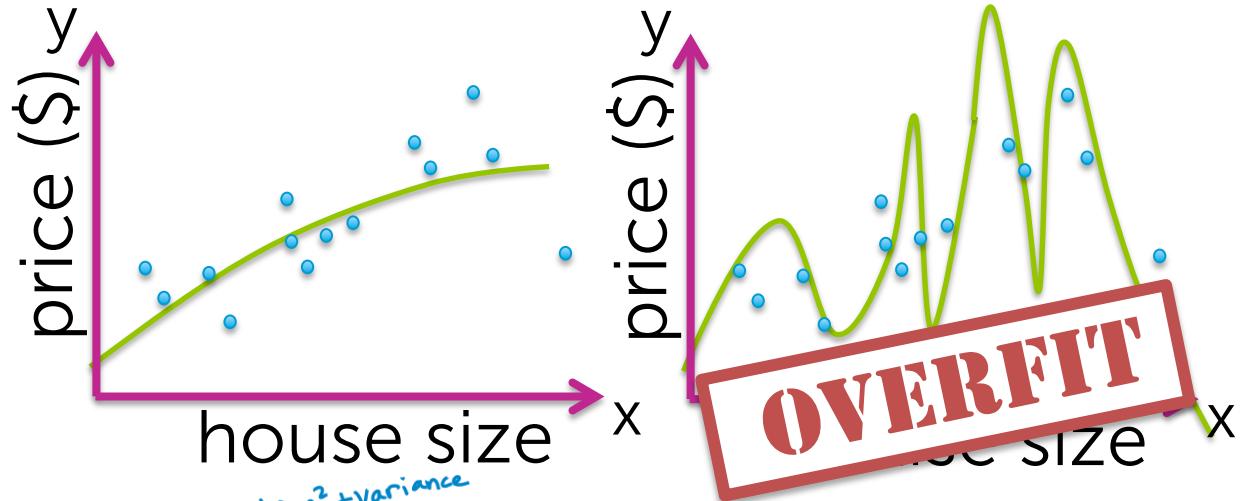

Module 3: Assessing Performance

Measures of error:

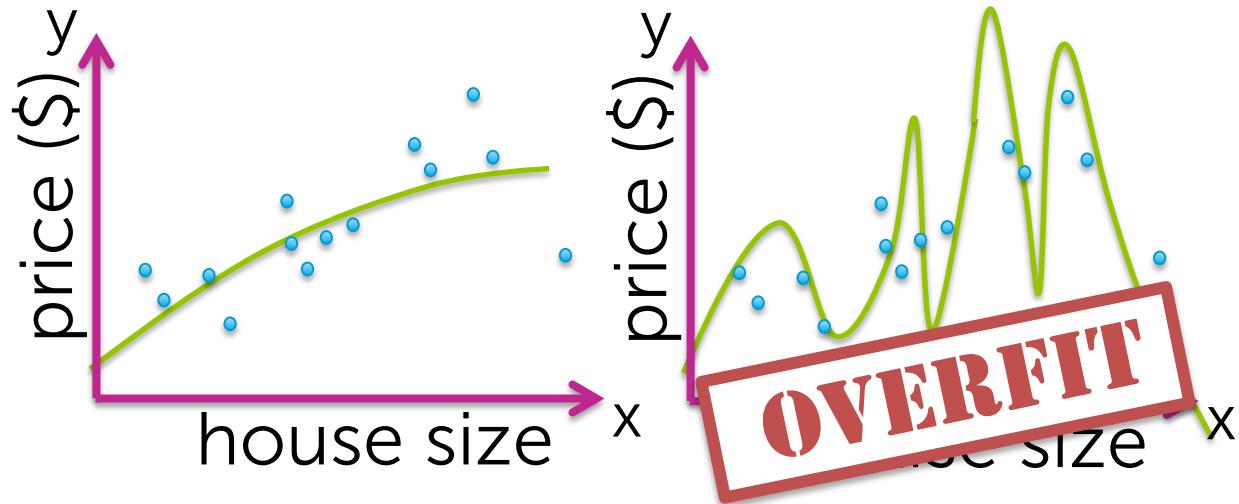

- Training
- Test
- True (generalization)

Module 3: Assessing Performance

Bias-variance
tradeoff

Module 4: Ridge Regression

Ridge total cost =
measure of fit + measure of
model complexity

bias-variance tradeoff

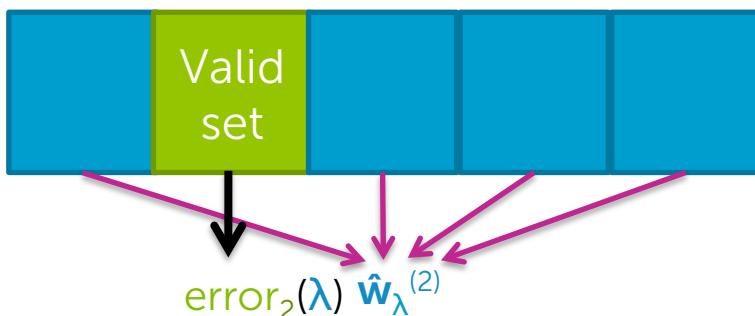

A diagram below the text shows a triangle with three arrows originating from its vertices. Two arrows point from the top-left vertex to the words "measure of fit" and "measure of model complexity". One arrow points from the bottom vertex to the text "bias-variance tradeoff".

Module 4: Ridge Regression

How to choose balance?
(i.e., model complexity)

measure of fit + measure of
model complexity

Cross validation

Module 5: Feature Selection & Lasso Regression

Useful for **efficiency** of predictions and **interpretability**

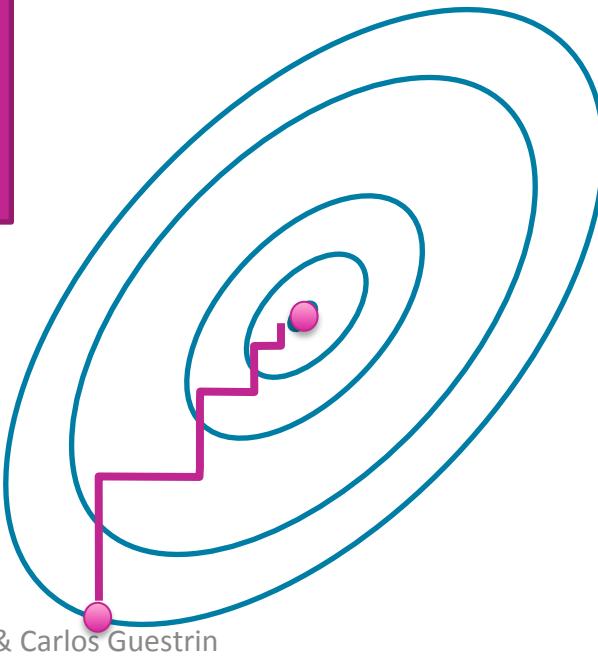

Lot size	Dishwasher
Single Family	Garbage disposal
Year built	Microwave
Last sold price	Range / Oven
Last sale price/sqft	Refrigerator
Finished sqft	Washer
Unfinished sqft	Dryer
Finished basement sqft	Laundry location
# floors	Heating type
Flooring types	Jetted Tub
Parking type	Deck
Parking amount	Fenced Yard
Cooling	Lawn
Heating	Garden
Exterior materials	Sprinkler System
Roof type	:
Structure style	:

Module 5: Feature Selection & Lasso Regression

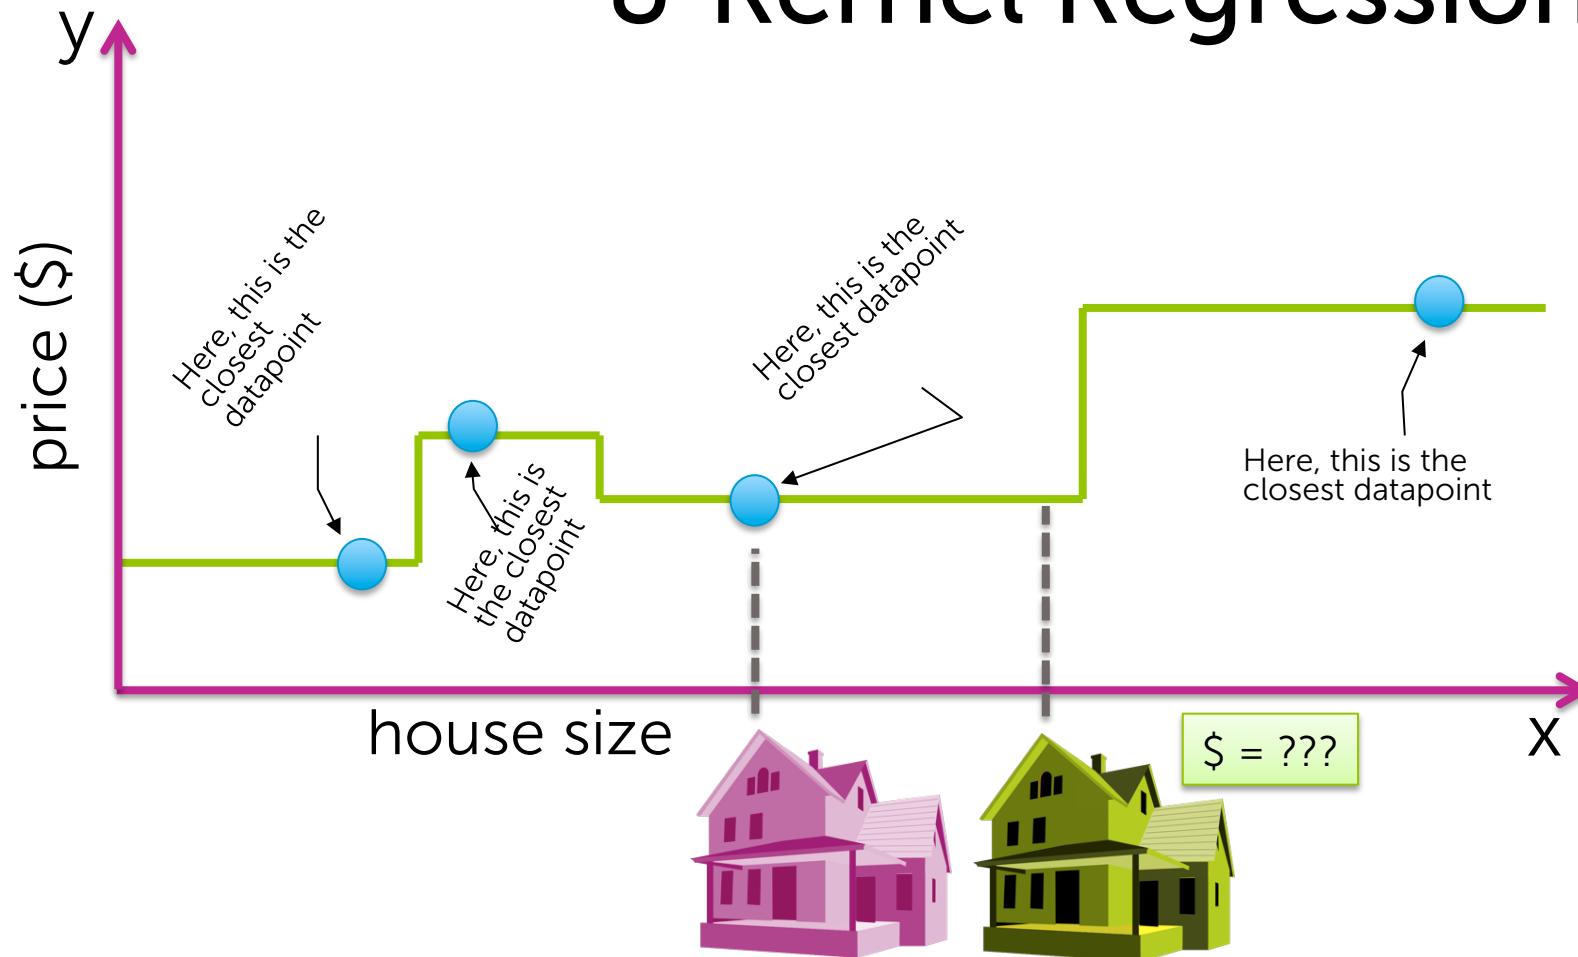

Lasso total cost =
measure of fit + (different) measure of
model complexity

knocks out certain features...
“sparsity”

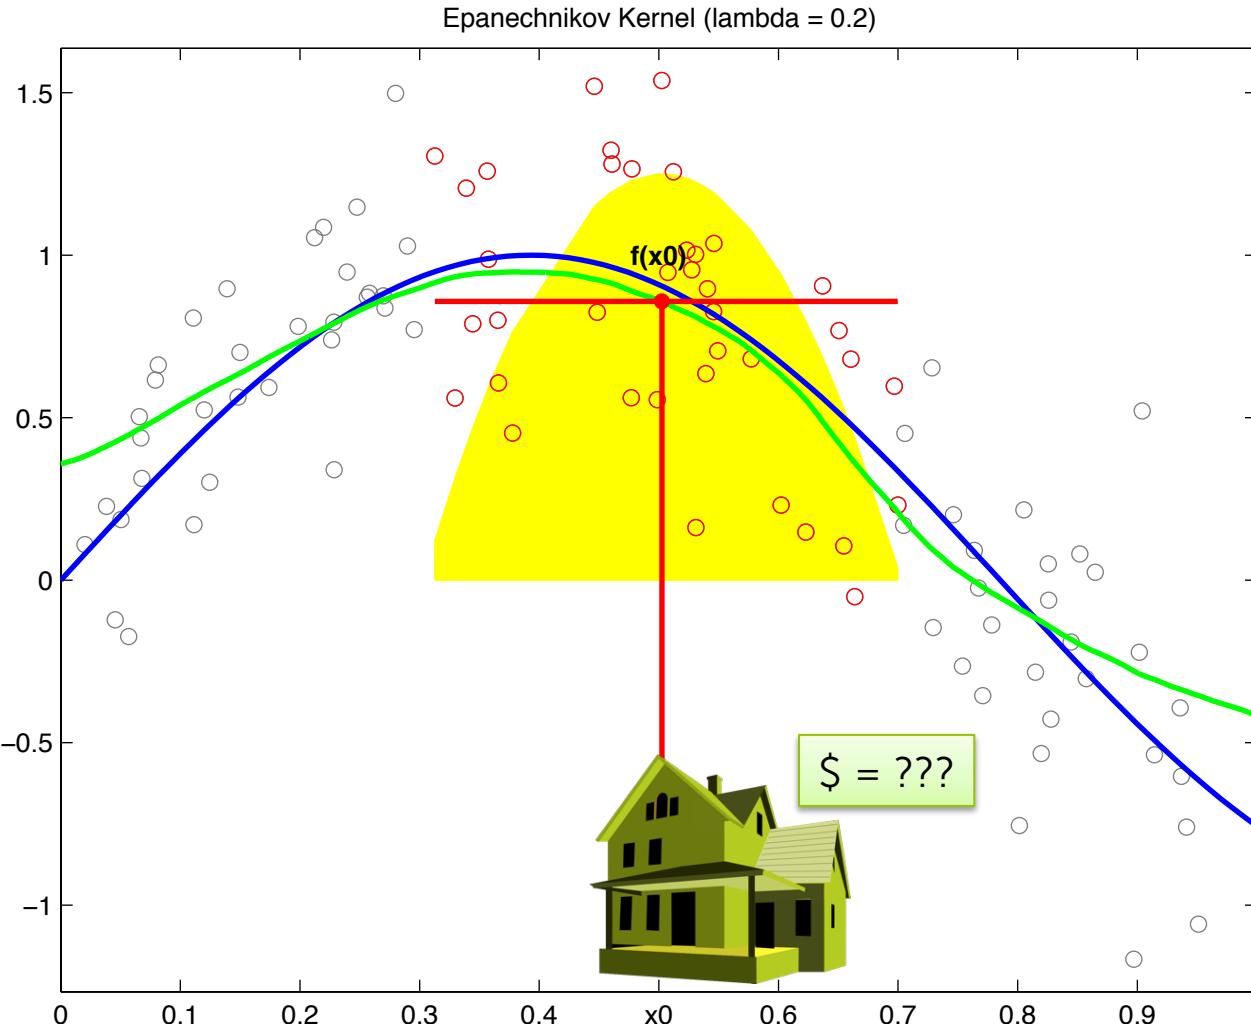

Coordinate descent algorithm

Module 6: Nearest Neighbor & Kernel Regression

Module 6: Nearest Neighbor & Kernel Regression

Summary of what's covered

Models

- Linear regression
- Regularization: Ridge (L2), Lasso (L1)
- Nearest neighbor and kernel regression

Algorithms

- Gradient descent
- Coordinate descent

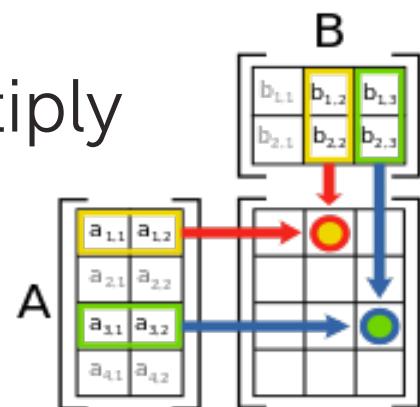

Concepts

- Loss functions, bias-variance tradeoff, cross-validation, sparsity, overfitting, model selection, feature selection

Assumed background

Math background

- Basic calculus
 - Concept of derivatives
- Basic linear algebra
 - Vectors
 - Matrices
 - Matrix multiply

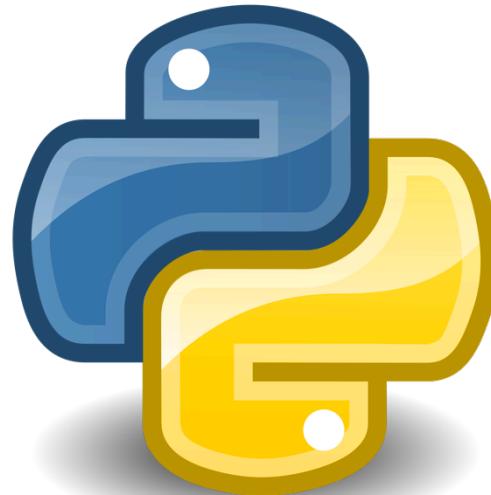

Programming experience

- Basic Python used
 - Can pick up along the way if knowledge of other language

```
get_user(self, user):
    """
    Returns a QuerySet of connections for user.
    """
    set1 = self.filter(from_user=user).select_related(depth=1)
    set2 = self.filter(to_user=user).select_related(depth=1)
    return set1 | set2

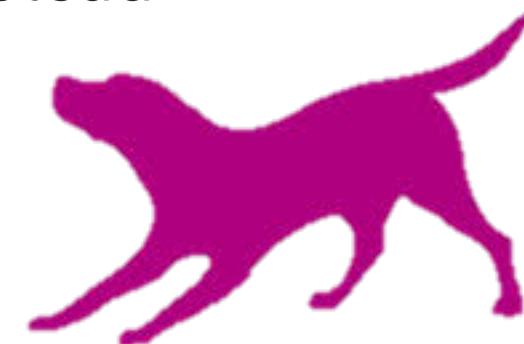

def are_connected(self, user1, user2):
    if self.filter(from_user=user1, to_user=user2).count() > 0:
        return True
    if self.filter(from_user=user2, to_user=user1).count() > 0:
        return True
    return False

def remove(self, user1, user2):
    """
    Deletes proper object regardless of the order of users in argument
    """
    connection = self.filter(from_user=user1, to_user=user2)
    if not connection:
        connection = self.filter(from_user=user2, to_user=user1)
    connection.delete()
---:--- models.py Top L1 (Python AC yas)---
```

Reliance on GraphLab Create

- SFrames will be used, though not required
 - open source project of Dato
(creators of GraphLab Create)
 - can use pandas and numpy instead
- Assignments will:
 1. Use GraphLab Create to explore high-level concepts
 2. Ask you to implement *all* algorithms without GraphLab Create
- Net result:
 - learn how to code methods in Python

Computing needs

- Basic 64-bit desktop or laptop
- Access to internet
- Ability to:
 - Install and run Python (and GraphLab Create)
 - Store a few GB of data

Let's get started!
